Reagents for Titration..... 04

- Prepared Reagents for Volumetric Analysis (Normal Solution)
- Reference Materials for Volumetric Analysis
- Indicators
- Standard Buffer Solution
- Reagents for Electrode
- Reagents for Colloidal Titration
- Reagents for Non-aqueous Titration
- TraceSure
- JCSS
- Karl Fischer Reagents [Mitsubishi Chemical Corp.]

Prepared Reagents for Volumetric Analysis (Normal Solution)
Reference Materials for Volumetric Analysis
TraceSure Series are certified reference materials that have obtained ASNITE (Accreditation System of National Institute of Technology and Evaluation) (Guide 34) at Wako from International Accreditation Japan (IAJapan) by the Accreditation Program.
Indicators
Highly versatile indicators and indicator solutions are readily available, centering around titration indicators listed in JIS K8001.
Standard Buffer Solutions
Wako has been qualified as an institution for calibration (licensed trader) of standard pH solutions, standard metal solutions and standard ion solutions by the Minister of Economy, Trade and Industry and offers the standard solutions traceable according to the National Metrology Standard. These products are provided with a calibration certificate marked with JCSS to certify that it is traceable according to the National Metrology Standard and, at the same time, attests to the supply of accurate and highly reliable reagent.
Reagents for Electrode
In potentiometric titration, polarographic method, controlled-potential electrolysis, pH measurement (by glass electrode), etc., calomel electrodes, silver-silverchloride electrodes, and other electrodes are used for reference electrodes. As the electrolyte solution of reference electrodes such as calomelectrodes, silver-silver chloride electrodes, etc., a potassium chloride solution of a predetermined concentration is used. In addition, the potassium chloride solution is used for the electrode preservation solution, too.
Reagents for Colloidal Titration
The colloidal titration method is titrimetry for simply determine the polymer electrolyte by titration. In general, colloids having positive or negative electric charges stoichiometrically react with colloids having opposite electric charges and form a sparingly water-soluble precipitation. In the event that the positive colloid is determined by the use of this principle, the solution is titrated with the normal solution of potassium polyvinyl sulfate (PVSK) having a negative electric charge. Toluidine blue of the indicator is a basic dyestuff having -NH2 and is not absorbed by the positive colloid, showing an original blue color, but when it encounters with a negative colloid, toluidine blue is immediately absorbed and assumes a red-purple color. The equivalent point of the reaction is, therefore, able to be simply and highly accurately detected.
Reagents for Non-aqueous Titration
In the event that an acid and a base are too weak to be titrated in an aqueous solution, they are titrated in an appropriate nonaqueous solvent. A wide range of solvents, standard solutions, and indicators are lined up for nonaqueous titration.
TraceSure
TraceSure Series product is the certificated reference material which has acquired a certificate of reference material producer by ASNITE certification program of National Institute of Technology and Evaluation, IAJapan. The certificate with the uncertainty of proof of the reliability is attached to each product.
JCSS
Wako has been qualified as an institution for calibration (licensed trader) of standard pH solutions, standard metal solutions and standard ion solutions by the Minister of Economy, Trade and Industry and offers the standard solutions traceable according to the National Metrology Standard. These products are provided with a calibration certificate marked with JCSS to certify that it is traceable according to the National Metrology Standard and, at the same time, attests to the supply of accurate and highly reliable reagent.
Karl Fischer Reagents [Mitsubishi Chemical Corp.]
Karl Fisher method uses Karl Fischer reagent, which reacts quantitatively and selectively with water, to measure moisture content. Karl Fischer reagent consists of iodine, sulfur dioxide, a base and a solvent, such as alcohols. This method can be used in both coulometric and volumetric titration systems.

Reagents for Metal Analysis..... 17

- Reagents for Atomic Absorption Spectrochemical Analysis
- Standard Metal Solutions
- Multielement Standard Solutions for ICP Analysis
- Reagents for Analysis of Poisonous Metals

Reagents for Atomic Absorption Spectrochemical Analysis
Atomic absorption spectrochemical analysis is used for determination of trace metals. Because of high sensitivity, high selectivity, and easy operation, atomic absorption spectrochemical analysis is an important analysis method of heavy meals in water, soil, and biological samples. As reagents used for atomic absorption spectrochemical analysis, high-quality pretreatment reagents of acids, alkalis, etc. and metal standard solutions with extremely little content of heavy metal impurities are readily available.
Standard Metal Solutions
Wako has been qualified as an institution for calibration (licensed trader) of standard pH solutions, standard metal solutions and standard ion solutions by the Minister of Economy, Trade and Industry and offers the standard solutions traceable according to the National Metrology Standard. This product is provided with a calibration certificate marked with JCSS to certify that it is traceable according to the National Metrology Standard and, at the same time, attests to the supply of accurate and highly reliable reagent.
Multielement Standard Solutions for ICP Analysis
These products are mixed reference standards for trace elements analysis by ICP (Inductively Coupled Plasma).
Reagents for Analysis of Poisonous Metals
Hg, Cd, Pb, As and other poisonous metals as environmental pollutants are measured at the ppb level by increased sensitivity of atomic absorption spectrometer, ICP emission spectral analysis/ICP mass spectroscopy, etc. Reagents for analysis of poisonous metals are reagentswith impurity metal content reduced to the maximum as reagents which are measured against these poisonous metals.

Highly-Pure Solvents / Acids..... 22

- Super Special Grade Reagents (S.S.G.)
- Reagents for Ultratrace Analysis
- Highly-Pure Reagents for Electronic Industries
- Infinity Pure Series (∞Pure)

Super Special Grade Reagents (S.S.G.)
Super special grade (S.S.G.) reagents are reagents with the highest quality standard guaranteed for which specification parameters and specification values of JIS special grade or higher are specified.
Reagents for Ultratrace Analysis
Each product guarantees the content of various metallic impurities at the ppt level.
In order to maintain the ppt-level quality for using fluororesin (PFA) containers (extra-pure water uses high-density polyethylene containers), PFA containers thoroughly cleaned before filling is used.
Double plastic bag packing used: Because single plastic bag (inside) packing is performed in the clean room, the reagents are able to be carried into the clean room as it is.
Inspection report attached: Impurity metal analysis by ICP-MS and FL-AAS is performed, and the analysis results are attached to the product.
Highly-Pure Reagents for Electronic Industries
High-purity organic solvents and acids for electronic industry. They are applicable to semicondenser field and have low contents of particles and metal impurities.
Infinity Pure Series (∞Pure)
Infinity Pure is a series of reagents characterized by the highest quality and small packaging unit (100 mL). The reagents, particularly those in the biochemical fields such as gene engineering, immunology and cell biology, are required to be highly purified with little secondary contamination after opening the package. This product is available in the package of 100 mL minimizing unused waste and it is a personal reagent with a space for recording the opening date, user name, etc. in the label.

Reagents for NMR..... 24

- Shift Reagents
- Internal Standard Reference Materials
- NMR Test Tubes

Shift Reagents
Shift reagents improve separation of signals making the best of the properties that the NMR peak positions are shifted. Adding these reagents can separate signals and facilitate the analysis.
Internal Standard Reference Materials
This is an internal standard reference material added to the NMR solvent when NMR is measured and is used for determining the shift positions of other peaks.
NMR Test Tubes
NMR test tubes are high-quality reasonable NMR glass tubes. There are S (standard) type used for the routine and HG (high-grade) type with smaller outside diameter and suited for measurement in the high-frequency region. In addition, the total tube length is available in two sizes, 7 inches and 8 inches, so that the tubes can be chosen to fit to measurement instruments used.

Wetting Tension Test Mixtures..... 25

Wetting tension test mixtures are used for plastics -films and sheets- in order to test the wetting tension. It is prescribed in JIS K6768.

CSK Standard Solutions for Analysis for Nutrient Salts in Seawater..... 26

Each solution is a standard solution prepared in response to the request from the International Cooperative Study of the Kuroshio and Adjacent Regions (CSK). CSK standard solutions were shared marine samples prepared to achieve the integrity of analysis of nutrient salts in seawater. No preservative is contained but the solutions are sterilized.

NMIJ Certified Reference Materials (NMIJ CRM)..... 27

NMIJ CRM is certified reference material supplied by NMIJ (National Metrology Institute of Japan). It is a reference material with the weighing traceability established, and determines the production by the Quality System in accordance with ISO Guide 34 and the certified value based on ISO Guide 35.
Certified Reference Material (CRM): A certified reference material valued by a metrologically adequate procedure with respect to one or more prescribed properties, and having a certification with the values of prescribed properties and their uncertainties, as well as metrological traceability stipulated.
Reference Material (RM): Material prepared to be sufficiently homogeneous and stable for one or more prescribed properties and to be suited for the intended use of the measurement process.

Iron Standard Solution (Fe 100 mg/L) JCSS	100 mL	091-03851
Isufenphos Reference Material TraceSure	100 mg	098-06541
Isoprothiolane Reference Material TraceSure	100 mg	098-06281
Isoxaben Reference Material TraceSure	100 mg	091-06531
Isoxathion Reference Material TraceSure	100 mg	095-06311
Lead Standard Solution (Pb 1,000 mg/L) JCSS	100 mL	124-04291
Lead Standard Solution (Pb 100 mg/L) JCSS	100 mL	127-04301
Lead Standard Stock Solution (Pb 100 mg/L) for JP General Tests	100 mL	122-06051

Product Name Grade	Manufacture's Code Package Size	Note for Shipment Wako Cat. No.
Linuron Reference Material TraceSure	100 mg	124-06131
Lithium Standard Solution (Li 1,000 mg/L) JCSS	100 mL	129-05221
Lithium Tetraborate Anhydrous Wako Special Grade	25 g	129-03602
Lithium Tetraborate Anhydrous Wako Special Grade	500 g	123-03605
0.05 mol/L Magnesium Chloride Solution for Volumetric Analysis	500 mL	135-14215
Magnesium Standard Solution (Mg 1,000 mg/L) JCSS	100 mL	136-12121
Magnesium Standard Solution (Mg 100 mg/L) JCSS	100 mL	136-13601
Magnesium Standard Stock Solution (Mg 1,000 mg/L) for JP General Tests	100 mL	137-17151
Malathion Reference Material TraceSure	100 mg	133-16891
Maleic Acid Reference Material TraceSure	100 mg	exc. US ※ 135-17951
Maltose Hydrate for JP General Tests	100 mg	134-16321
Manganese Standard Solution (Mn 1,000 mg/L) JCSS	100 mL	133-12131
Manganese Standard Solution (Mn 100 mg/L) JCSS	100 mL	139-12111
MCP Reference Material TraceSure	100 mg	135-16971
MCPP Reference Material TraceSure	100 mg	136-16901
Mefenacet Reference Material TraceSure	100 mg	130-16921
MEP Reference Material TraceSure	100 mg	133-16911
Mepronil Reference Material TraceSure	100 mg	134-16941
Metalaxyl Reference Material TraceSure	100 mg	137-16931
Methomyl Reference Material TraceSure	100 mg	132-17461
Methyl Dimethyldithiocarbamate Reference Material TraceSure	100 mg	132-17961
Methyl Glycol Chitosan for Colloidal Titration	10 g	134-04731
Methyl Glycol Chitosan Titration Solution (N/200) for Colloidal Titration	500 mL	137-14655
0.1 w/v% Methyl Orange Solution [Indicator] for Neutralization Titration	100 mL	132-10783
0.1 w/v% Methyl Orange Solution [Indicator] for Neutralization Titration	500 mL	138-10785
0.1 w/v% Methyl Red Ethanol Solution for Titration	100 mL	133-14113
0.1 w/v% Methyl Red Ethanol Solution for Titration	500 mL	139-14115
Methyl Red-Methylene Blue Ethanol Solution for Titration	100 mL	137-14133
Methyl Thioacetohydroxamate Reference Material TraceSure	100 mg	138-17441
MIPC Reference Material TraceSure	100 mg	139-17971
Molinate Reference Material TraceSure	100 mg	131-16951

※exc. = except

Wetting Tension Test Mixtures

■ **Wetting Tension is ...**

The ability of plastic films to retain inks, coating, adhesives, etc., is primarily dependent on the character of their surfaces, and can be improved by one of several surface-treating techniques. These techniques have been found to increase the wetting tension of a plastic film surface in contact with mixtures of solvents. It is therefore possible to relate the wetting tension of a plastic film surface relates to its ability to accept and retain inks, coatings, adhesives, etc.

The condition with water drops placed on the surface is not defined to be wet (Fig. 1). To let the surface get wet with a liquid with strong surface tension as in the case of water, the film surface must have the property to blend into water (high polarity). Conversely, with the solvent with weak surface tension as in the case of organic solvent, the film surface gets wet even if the film surface has a property to repel water. Consequently, when plastic film is coated with paint, provided with coating, or bonded, it is important to know the wetting tension of plastic film. (Prescribed in JIS K6768.)

■ **Principle**

A series of mixtures of solvents of gradually increasing surface tension are applied to the surface of the plastic film until a mixture is obtained that just wets the film surface. The wetting tension of the surface under test is approximately by the surface tension of this particular mixture.

■ **Wetting Tension Test Mixture**

36 kinds of test mixtures of graduated wetting tension are available for wetting tension test.

■ **Procedure**

A cotton-tipped stick is used for spreading the test mixtures and the liquid shall be spread rapidly over an area of at least 20 cm2. The quantity of liquid shall be such that it forms a thin film without pools. Impregnate the mixture and apply only one coat to the film in the lateral direction. The amount of the liquid applied exerts great effect on the accuracy of the test, to which care must be taken.

- **In the case of excess application**
The liquid film does not break from the film inside but shrinks from the surrounding, and forms a large liquid drop (large measurement value results)
- **In the case of application of an appropriate amount**
Breakage of coated liquid film simultaneously occurs not only from the surrounding but also the center part of the film
- **In the case of application of excessively small amount**
In the case of application, breakage of liquid film occurs in the direction where the cotton-tipped stick is moved and application irregularity is formed (small measurement value results).

■ **How to determine**

Observe the liquid film of the test mixture under glancing illumination and note the time taken for the continuous liquid film to break up into droplets. If the liquid film holds together for more than 2 seconds, repeat the test on a new specimen with a mixture of the next higher surface tension, until the liquid film breaks up in less than 2 seconds. If the liquid film holds for less than 2 seconds, proceed to lower surface tensions until the film persists for 2 seconds. (Fig. 2)
